# WATER MATTERS

The miracle of nature

## MEET JOHANN GRANDER

### »»» READ MORE

Johann Grander was an Austrian inventor and entrepreneur who developed a water treatment technology called the GRANDER rod. The GRANDER rod technology is based on the principle of water revitalization, which aims to enhance the natural properties of water and improve its quality.

### READ MORE «««

The GRANDER rod technology is a simple and effective way of treating water, which involves placing a rod in the water source. The rod contains a special mixture of minerals and crystals, which are said to generate a field of energy that revitalizes the water.

## HOW THE GRANDER ROD WORKS

*continued on page 2*

# HOW THE GRANDER ROD WORKS

## »»» WATER CARRIES INFORMATION

The idea behind the technology is that water has a memory and can be influenced by its environment. By exposing the water to the energy generated by the GRANDER rod, it is believed that the water molecules become more organized and structured. This, in turn, is said to improve the taste, quality, and overall properties of the water.

## THE EFFECT ON WELL-BEING

Scientists are divided on the efficacy of the GRANDER rod technology. While some studies have suggested that the technology positively affects water quality, others found no significant differences between treated and untreated water.

## »»» WELL-BEING

Many people who use the GRANDER rod technology claim that it positively affects their health and well-being. They report feeling more energized, experiencing fewer health problems, and generally feeling better overall.

Despite the controversy, the GRANDER rod technology has gained a following around the world, with many people using it to improve the quality of their drinking water. Whether or not the technology is truly effective, there is no doubt that Johann Grander was a pioneer in the field of water treatment, and his legacy continues to inspire innovation and experimentation in this important area of research.

Day 4 - With Filtration & GRANDER

# HOW THE GRANDER ROD WORKS

## »»» HOW ARE GRANDER RODS MADE?

The exact process of creating a GRANDER rod is a closely guarded trade secret, but it is known that the rods are made from a specific blend of minerals and crystals that have been carefully selected and combined to create a specific energy field. The rods are created through a process that involves heating, cooling, and shaping the minerals and crystals into a specific form.

## THE REVITALIZATION PROCESS

## »»» HOW DO THEY WORK?

The energy field generated by the GRANDER rod is said to interact with the water molecules and enhance their natural properties. The rods are placed in water sources such as tanks, pipes, or containers, where they generate an energy field that revitalizes the water.

The theory behind the technology is that water has a memory and can be influenced by its environment. By exposing the water to the energy generated by the GRANDER rod, it is believed that the water molecules become more organized and structured. This, in turn, is said to improve the taste, quality, and overall properties of the water.

# GROWTH CONTEST

WIN ONE FREE DELIVERY OF OUR WATER

## »»» THE CONTEST

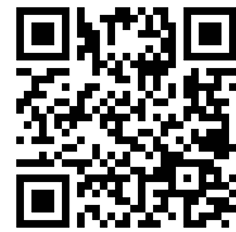

We'd like to challenge our delivery customers to compare plant growth using our local, untreated city tap water and the RO water we deliver to your door. You can use your outside garden hose to get the water before it goes through your inside softener/filtering system.

Compare the growth of an identical plant in two different grow pots of your choosing. Use your regular water in one, and the water we deliver in the other grow pot. Take pictures at different stages of growth to show us any differences. Our team will pick the best comparison each month and select the winner and publish their pictures in our newsletter.

## »»» SOME IDEAS

Because we have so many different sources of water available to us, you might even decide to use our water versus another supplier's water. Or maybe plain RO water versus our RO water that has been treated with the GRANDER rods and sound and pictures from Masaru Emoto's water crystal experiments (the subject of next month's newsletter). You can see some of the crystal formations that Masaru Emoto uncovered on our website in the YouTube documentary we published. You can go to this link: <https://www.rainbowwaterandice.com/revitalization.php> to view it.

## »»» 5 FAST-GROWING HERBS TO TEST

This might help you to get started in this contest:

- **Wheatgrass** - A great choice for people who like to make juices.
- **Basil** - Basil is one of the fastest-growing herbs that people love.
- **Parsley** - Parsley is another fast-growing herb used in cooking.
- **Cilantro** - Cilantro is a popular herb used in Mexican and Indian cuisine. But it is also used widely in cooking.
- **Dill** - Dill seeds can take up to 10 days to germinate, but once they do, the plant grows quickly and can reach up to 3 feet tall.
